Title: Canadian Well Identifier System, What Does it Mean for You?

Description: The Canadian Well Identification System (CWIS) is an identifier whose time has come. CWIS is planned to be implemented by the Alberta Energy Regulator (AER) in the near future. This talk breaks down the concepts behind it and explains how it can be a valuable tool for you. CWIS addresses the limitations of the UWI, while not replacing it. Yes, your UWI is safe!

Our industry is one of constant change, driven by the need to address our environmental footprint, reduce our cost, and embrace new technologies. We no longer predominately drill just single vertical boreholes, and the management of the data of wells needs new tools like CWIS to address these changes. De-mystifying the CWIS, walking through examples of CWIS, and talking in practical terms about the benefits will all be discussed in this talk.

Join Katalyst Data Management and the Calgary Geoscience Data Managers Society to learn more about the CWIS and how this could affect your organization.
