**Title:** **NMR for Rock Core Analysis**

**Description:** Nuclear magnetic resonance (NMR) can be used to investigate both the types of fluid present and the size of the pores the fluids occupy. As a result, NMR has become a powerful tool in the core analysis laboratory. At H2 Laboratories, we are continuing to expand the capabilities of NMR for core analysis. In the first half of this talk, we will present some of our latest research including how NMR can be used to track wettability of core samples and determining gas isotherms from NMR data. In the second half of this talk, we will present an overview of the capabilities of H2 laboratories and how we can help analyze your core.
